What Noida Unrest tells Us About Capital and Labour

GS Paper III: Labour and Economy

Context:

Industrial unrest in **Noida's garment and light manufacturing units** has drawn attention to worsening labour conditions, stagnant wages, and structural weaknesses in India's manufacturing-led growth model.

Trigger of the Protests:

- **Deteriorating labour conditions:** Workers report routine **12-hour shifts** despite common legal limits of **8–9 hours**, indicating weak enforcement of labour regulations.
- **Low wages amid rising costs:** Monthly wages around **₹13,000–₹15,000** are insufficient given rising housing, utility, and health costs.
- **Violation of labour laws: Overtime payments,** legally required at double the rate, are often **unpaid or paid at normal rates.**
- **Erosion of collective bargaining: Integration into global production networks** has **weakened labour power** through automation, contractualisation, and production shifting.

Strategies of Capital to Break Collective Bargaining:

- **Automation:** Factory owners increasingly **introduce machines** and automated processes that **reduce dependence on skilled labour,** thereby making the experience and bargaining power of older workers less relevant.
- **Contractualisation of labour: Firms replace permanent employees with contract workers** who are easily replaceable, lack job security, and generally cannot unionise, weakening organised labour movements.
- **Production shifting:** Manufacturing units are **relocated to regions where labour laws are weaker or poorly enforced**, allowing firms to avoid stricter regulations and collective bargaining pressures.

About Real Wages:

- **Meaning:** Real wages refer to **nominal wages adjusted for inflation**, indicating the actual purchasing power of income.
- **Formula: Real Wage = Nominal Wage – Inflation** (i.e., what a worker earns minus the rise in prices).
- **Significance:** Real wages show **how much goods and services a salary can actually buy**, reflecting the true standard of living of workers.
- **Hidden erosion of income:** Even if nominal wages increase, **high inflation can reduce real purchasing power**.

India vs. the East Asian Industrialisation Model:

- **Real wage growth:** In countries like **South Korea** and **Taiwan, real wages increased steadily during industrialisation,** ensuring workers benefited from economic growth.
  - In contrast, in India, **inflation outpaced manufacturing wage growth** between 2019–2023, leading to **stagnating or declining real incomes.**
- **Productivity growth and value-chain upgrading:** East Asian economies rapidly moved up the value chain—from labour-intensive goods (e.g., garments) to electronics, automobiles, and advanced manufacturing, supported by rising productivity.
  - **India,** however, has experienced **slow productivity growth**, and its **garment exports remained largely stagnant** between **2013–2023,** while **Bangladesh and Vietnam expanded significantly.**
- **State-supported social protection:** Governments in East Asia **complemented industrialisation** with **public housing, healthcare, and social welfare,** reducing the cost of living for workers.
  - Comparable large-scale social support systems for industrial workers remain limited in India.

Structural Failures and the "Missing Middle":

- **Skipped structural transition:** Unlike many industrialising economies, **India moved directly from agriculture to services**, bypassing large-scale labour-intensive manufacturing.
- **Low manufacturing share: Manufacturing** has remained **stagnant** at about **13–16% of GDP,** limiting its role as a mass employment generator.
- **Weak job quality:** Many manufacturing jobs are characterised by **low wages, long hours, and limited social security,** reducing their attractiveness and dignity for workers.
- **Risk to demographic dividend:** Without productivity growth, skill development, and quality employment, **India's large working-age population could become a demographic burden** rather than a demographic dividend.

Conclusion:

The Noida unrest highlights the urgent **need to address labour conditions, real wages, and industrial upgrading**, as ignoring these issues could **turn India's demographic dividend into a demographic disaster.**

Mains Practice
Q. Suppressing wages and weakening labour laws cannot act as a sustainable substitute for genuine industrial upgrading. In the light of recent industrial unrests, critically evaluate the growth trajectory of India's manufacturing sector compared to East Asian economies. (250 Words, 15 Marks)

The Education Crisis

GS Paper II: Issues related to Education

Context:

India is witnessing a **growing divide** between **STEM and humanities education** that prioritise economically profitable subjects over broader intellectual development.

The Hierarchy of Subjects and "Techno-Capitalism":

- **Subject stratification:** A rigid academic hierarchy has emerged where **STEM** disciplines are seen as **"hard"** and **prestigious**, while **Humanities and Social Sciences** are labelled **"soft"** and **less valuable.**
- **Market-driven education:** Under the influence of **techno-capitalism**, **education is increasingly oriented toward marketable skills,** with subjects valued mainly for their ability to generate high-paying jobs.
  - Techno-capitalism refers to an economic system where **technology, digital platforms, and market forces dominate economic and social life**, shaping how knowledge, work, and education are valued.
- **Utilitarian view of knowledge:** The pursuit of knowledge for **intellectual enrichment** is increasingly being replaced by **utilitarian thinking**, where disciplines are valued mainly for their **economic returns**.
- **Stigma of subject choice: Opting for non-science streams** is often unfairly perceived as a **sign of academic weakness** rather than a legitimate interest or aptitude.
- **Teacher demotivation:** Humanities and social science teachers increasingly feel **undervalued** as their **disciplines are dismissed as "imaginative" subjects** with **limited career prospects.**

The Crisis in Science Education:

- **Lack of genuine scientific curiosity:** Many students opt for the Science stream due to **parental pressure** and **expectations of high-paying careers** rather than a genuine interest in scientific exploration.
- **Rise of the coaching ecosystem:** The growing **dominance of coaching centre**s and **"dummy schools"** (institutions students visit only for exams) has **shifted learning away from formal schooling**, **reducing schools to mere examination platforms.**
- **Exam-oriented learning:** Coaching institutes often t**rain students primarily to solve MCQs for entrance exams,** undermining conceptual understanding, creativity, and innovation.

Join Whatsapp
Join Telegram

- **The "PCM Syndrome":** An excessive focus on **Physics, Chemistry, and Mathematics (PCM) narrows academic exposure** and confines students within a limited disciplinary framework.
  - **As a result,** the **education system** increasingly **produces exam-oriented students** rather than scientifically curious thinkers, weakening the culture of innovation and inquiry.

Social and Civic Consequences:

- **Empathy deficit:** Excessive emphasis on technical education can create an **empathy deficit**, where individuals have limited understanding of social realities, politics, and the lived experiences of others.
- **Weakening of democratic citizenship:** Marginalising social sciences **reduces exposure** to **history, political thought, and civic values**, weakening the foundations of informed and responsible democratic participation.
- **Loss of critical and reflective thinking:** Humanities cultivate **ethical reasoning, critical inquiry, and cultural understanding**, which are essential for addressing complex societal challenges.
- **Need for non-STEM thinkers:** Society requires **historians to interpret the past, philosophers to question assumptions, and poets and writers to articulate human experiences**, ensuring a balanced intellectual ecosystem.

Way Forward:

- **Promote multidisciplinary education (NEP):** The **National Education Policy 2020** encourages **flexible subject choices**, allowing students to combine STEM with humanities, breaking rigid academic silos.
- **Shift from rote to reasoning-based learning:** Education must prioritise **conceptual understanding and critical thinking**, encouraging students to ask **"why" and "how"** rather than memorising facts.
- **Reform assessment systems:** Move beyond exam-centric evaluation toward **analytical, application-based, and research-oriented assessments** to foster innovation.
- **Regulate coaching culture:** Strengthen formal schooling and **reduce over-reliance on coaching centres and dummy schools** to restore holistic learning environments.
- **Inculcate scientific temper:** As envisaged under **Article 51A(h)**, education should promote a **spirit of inquiry, rational thinking, and curiosity** among all citizens.

Conclusion:

India must foster a multidisciplinary, inquiry-driven education system that **balances STEM and humanities** to nurture both innovation and responsible citizenship.

Mains Practice

Q. The increasing commercialisation of education, evident in the normalisation of 'dummy schools' and the obsession with STEM fields, is eroding the foundational values of democratic citizenship and critical thinking. Analyse this statement in the context of the current education system in India. (250 Words, 15 Marks)

Blind Spot In India's Migration Governance

GS Paper II: Governance

Context:

India's evacuation of citizens from West Asia highlights **a strong crisis response** but **underscores the need for comprehensive migration governance** beyond emergencies.

- India still tends to engage with migration mainly during crises, **rather than governing the entire migration cycle** — recruitment, mobility, work conditions, welfare, and return.

Gulf Region: Central to India's Migration Economy

- **Major destination for Indian migrants:** The **Gulf Cooperation Council (GCC)** countries host nearly **99.35 lakh Indians (December 2025)**, making the region one of the largest destinations for India's overseas workforce.
- **Key source of remittances:** The Gulf accounts for about **37.9% of India's total remittance inflows (2023–24)**.
- **Economic vulnerability to regional instability:** Any **political or security instability in West Asia** can directly affect **Indian households, district-level economies, and state welfare systems**.

Fragile and Thinly Institutionalised Migration Chains:

- **Weakly institutionalised migration networks:** India's internal and international migration systems rely on **informal, loosely regulated networks of recruiters, contractors, and intermediaries**, making them structurally fragile.
- **Lessons from the COVID-19 crisis:** The pandemic exposed these weaknesses when **millions of migrant workers were stranded**, highlighting the lack of adequate institutional support and social protection.
- **Growing economic pressures on migrants: Rising living costs, LPG price increases, tightening labour conditions, and sectoral slowdowns** are gradually undermining the stability of migrant workers.
- **Invisible accumulation of risks:** These pressures **build up quietly and often remain unnoticed by policymakers**, becoming **visible only when major disruptions or crises occur.**

Fragmented Institutional Architecture:

- **Multiple ministries involved:** Migration governance is **divided** among different institutions:
  - **Ministry of External Affairs** -emigration clearance and diplomacy,
  - **Ministry of Labour and Employment** - labour welfare and recruitment regulation, and
  - **State governments**- skilling and welfare schemes.
- **Institution–Migration Mismatch:** A migrant's journey spans **source districts, recruitment networks, international labour markets, and return migration**, cutting across administrative jurisdictions.
- **Partial institutional visibility:** As responsibilities are fragmented, migrant workers remain **visible to individual agencies but rarely to the system as a whole**, weakening coordinated governance and policy response.

Data Deficit and Governance Blind Spots:

- **Lack of migration data:** India lacks **real-time, detailed data on migrant workers**, limiting the government's ability to anticipate migration trends and risks.
- **Administrative gap in normal times:** In routine conditions, this data deficit creates **policy blind spots** in planning welfare, labour protection, and migration management.
- **Major challenge during crises:** During disruptions, the absence of reliable data makes it difficult for governments to **track migrants, assess their conditions, and manage return and rehabilitation effectively**.

Proposed Solutions and Models:

- **Kerala model of migration governance:** Kerala has institutionalised migrant welfare through the **Non-Resident Keralites Affairs Department**, a dedicated body with authority and staff to support overseas workers.
- **Legislative framework for mobility:** The proposed **Overseas Mobility Facilitation and Welfare Bill** aims to create a structured system for managing overseas worker mobility and ensuring their welfare.
- **Anticipatory governance approach:** A **"whole-of-the-journey" model** is proposed to track migrants from **departure to employment abroad and eventual return**, supported by a **single institutional helpline or entry point** for assistance.

Conclusion:

India must shift from reactive evacuation-based responses to **anticipatory, institutionally coordinated migration governance** that protects workers throughout their migration journey.

Mains Practice

Q. India's migration governance often responds well to disruption but struggles across the full continuum of mobility. In this context, analyse the need for a 'whole-of-journey approach' in managing internal and international migration. (250 Words, 15 Marks)
