Topics

India's Science lags—Talent exists, Leadership Doesn't

GS PAPER III: Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology.

Context:

In the current global landscape, **India stands at a crossroads where its immense human potential** in science often **encounters the friction of systemic inefficiency.**

The Core Problem

What is wrong with Indian Science?

- The primary issue is a culture that prioritizes **optics** over actual scientific discovery.
- Success is currently measured by the **quantity** of research papers and the number of committees a scientist joins, rather than the quality or problem-solving impact of the work.
- This has created a **"Publish or Perish"** culture where scientists are pressured to produce headline-catching results to satisfy government visibility rather than long-term societal needs.

The Root Cause

Deep Tech Deficit – Where India lags.

- India suffers from a significant **Deep Tech Deficit**, referring to a lack of advanced, rigorous engineering and research that solves complex global problems.
- While the country produces many startups, they are **often service-oriented (like food delivery)** rather than deep-tech innovators like OpenAI.

Key Deep-Tech Areas:

India's research presence is currently negligible in critical future-facing sectors, including:

- Semiconductors & Microchips.
- Advanced Material & Nanotechnology.
- Carbon Capture Utilization and Storage (CCUS).

Talent is NOT the problem – Incentives are:

- The sources emphasize that **India does not lack talent;** graduates from top Indian institutions like the IITs are leading global giants like Google and Microsoft.
- The failure lies in a **structural problem** where incentives are geared toward awards and medals rather than providing scientists the time and autonomy needed for rigorous research.

The Golden Era – Bhabha & Sarabhai's Legacy

Visionary Leaders:

- **Homi J. Bhabha:** Established the Tata Institute of Fundamental Research (TIFR) and the Bhabha Atomic Research Centre (BARC).
- **Vikram Sarabhai:** The visionary behind ISRO, who brought immense pride to the nation.

These leaders succeeded because they had **direct access to the Prime Minister** (Nehru) without bureaucratic interference and provided their subordinates with the **autonomy** to develop ideas over time.

Present Challenges – Institutional Inertia

- **Core Problems:** Today, the system is plagued by **Institutional Inertia**, where institutions resist change and stifle innovation.

- **Risk Averse:** Bureaucrats, who now sit between scientists and political leaders, tend to be risk-averse and focus on **"saving their own skin"** rather than supporting bold research.
- **Hierarchical Structure:** The system is heavily top-down, requiring excessive approvals—sometimes **over 60 approvals for a single piece of lab equipment**—which can stall vital research for months.
- **Lack of Administrative Courage:** Scientists often lack the courage to speak up about systemic flaws for fear that their funding or grants will be revoked.
- **Focus on Publishing Research Papers: R&D Spending – USA, China, India:**
  - A major structural barrier is the lack of investment. While India is the third-largest publisher of research papers globally, its **R&D spending is only 0.65% of GDP**, compared to **3% in the USA** and **2.5% in China**.

Way Forward – Building a Merit-Driven Ecosystem

India's Strengths:

- **Demographic Dividend**: India has a young population, though this "window" is slowly closing as the population ages.
- **Government Initiatives:** Recent steps include the **National Quantum Mission**, the **National Research Foundation**, and new **Deep Tech policies**.
- **4 Key Solutions:**
  - **Embrace Academic Reform:** Move away from "file-pushing" and bureaucratic culture toward a system of **complete trust** in scientists.
  - **Significantly Increase R&D Funding:** India must spend more on research to create jobs and transition into a developed economy.
  - **Empowering Young Scientists:** Shift the focus toward supporting young researchers and providing them with the resources to innovate without fear.
  - **Adopt the ISRO Model:** Implement an **outcome-based approach** that combines high autonomy with clear accountability, similar to India's successful space missions.

Mains Practice:

Q. Despite possessing a massive demographic advantage and world-class scientific talent, India lags significantly behind global leaders in deep-tech and fundamental research. Analyze the structural and institutional bottlenecks responsible for this deficit and suggest measures to create a merit-driven scientific ecosystem. (250 Words, 15 Marks)

80th NSO Data: Improved Health-Seeking and Lower Out-of-Pocket Costs

GS PAPER II: Issues related to Health.

Context:

The recent release of the **National Sample Survey Office (NSO) 80th Round data** provides a critical window into India's evolving **health-seeking behavior**.

Key Concepts:

- **Out of Pocket Expenditure (OOPE):** This refers to the direct payment a family makes for healthcare that is not covered by insurance. High OOPE can lead to a **"Medical Poverty Trap,"** where health costs push families into poverty.
- **PFRA**: It stands for **Persons per Thousand Reporting Ailment**, a metric used to track how many people actively report an illness.

- **Hidden Morbidity:** Historically, **rural populations would hide diseases like TB** or Polio due to **social stigma** or the absence of affordable treatment; this culture is now declining as reporting increases.

NSO 80th Round – Key Data Highlights

- **Paradox of Rising Ailments:** There is a notable increase in the percentage of people reporting ailments. In rural areas, reporting rose from **6.8% to 12.2%**, and in urban areas from **9.1% to 14.9%**. This "paradox" does not necessarily mean more people are getting sick, but rather that **reporting has increased** as people are more willing to seek help.
- **Health Insurance Surge:** Primarily due to the **Ayushman Bharat scheme**, insurance coverage has skyrocketed. Rural coverage increased from **12.9% to 45.5%**, while urban coverage rose from **8.9% to 31.8%**.
- **Public Healthcare Trust:** Trust in government hospitals is growing because private healthcare is becoming prohibitively expensive.

Maternal Health – NSO Data

- **Institutional Deliveries:** India has seen a massive shift toward hospital-based births. Rural areas now see 95.6% institutional deliveries, while urban areas are at 97.8%.
- **Who delivers babies in Rural India?**
  - Government Hospitals: 66.8%.
  - Private Hospitals: 33.2%.
- **Urban Delivery Share:**
  - Government Hospitals: 47%.
  - Private Hospitals: 53%.

Why did this change?

Key Drivers

- **Enhanced Public Investment:** The establishment of Ayushman Health and Wellness Centers in villages has allowed for better diagnosis of conditions like blood pressure and sugar.
- **Epidemiological Transition:** India is shifting from a focus on **infectious diseases** (like Malaria) to **Non-Communicable Diseases (NCDs)** (like Diabetes), which require long-term treatment and more frequent doctor visits, leading to higher reporting.
- **Free Drugs:** Public hospitals now offer basic medicines and diagnostics for free, encouraging more people to seek formal care.

Interlinkages – Health, Economy, SDGs

- **Amartya Sen's Capability Approach:** Healthy individuals are "capable" individuals; a sick laborer cannot contribute to the economy.
- **SDG 3:** Good Health and Well-being for all.
- **SDG 1:** No Poverty (reducing OOPE prevents families from falling back into poverty).

Persistent Challenges

- **High Out of Pocket Expenditure:** Despite insurance, advanced healthcare often requires expensive private sector visits.
- **Capacity Constraints:** Government hospitals face extreme **overcrowding** (sometimes two patients per bed) and a severe **shortage of doctors**.
- **Fragmented Governance:** Health is a **State subject**, leading to massive disparities; for example, the healthcare system in **Kerala** is significantly more advanced than in **Bihar**.

Way Forward

- **Increase Funding: Health s**pending should reach 2.5% of GDP (currently it fluctuates between 1.9% and 2.1%).
- **Regulate Private Costs:** Governments should implement rules to cap what private hospitals can charge for treatments.
- **Leverage Digital Health:** Use tools like **e-Sanjeevani** (teleconsultation) and **ABHA IDs** (digital health records) to reach remote villages.
- **Community Participation:** Engaging **Panchayats** and **ASHA workers** is vital for spreading awareness and ensuring local accountability.

Mains Practice:

Q. Despite an increase in health-seeking behaviour and insurance coverage as revealed by the NSO 80th Round Health Survey, out-of-pocket expenditure (OOPE) remains a significant challenge for India's healthcare system. Analyze the reasons why OOPE persists even with expanding insurance coverage, and suggest comprehensive measures to overcome this challenge. (250 Words, 15 Marks)

On May Day, a Workforce in India without a floor

GS PAPER III: Indian Economy and issues relating to employment.

Context:

Every year **on May 1,** the world observes International Workers' Day to honour the historic struggles of workers for rights such as fair wages, safe working conditions, and dignity at work.

Key Concept

- **Living Wage ≠ Minimum Wage**
  - **Living Wage:** This refers to the wage required for a worker to lead a dignified life, accounting for modern costs like high rent, LPG cylinders, and education.
  - **Minimum Wage:** This is the **statutory floor price** or the minimum level of payment fixed by the government. The sources argue that current minimum wages in areas like Delhi-NCR are insufficient to meet the standards of a living wage.

May Day – A Diagnosis, Not a Celebration

What is May Day?

- **May Day is observed on May 1st t**o commemorate a massive protest by workers in Chicago, USA, on May 1, 1886. The workers were demanding safe working conditions and a limit of 8 hours of work per day.
- **Two Real World Events Exposed**: The sources highlight two recent incidents that underscore the ongoing struggles of the labor force:
  1. **Noida Garment Strike** (April 10, 2026).
  2. **Vedanta Boiler Blast** in Chhattisgarh.

Two Tests of Any Labour Law?

According to the sources, any labor law must be evaluated against two fundamental questions:

1. Is the worker earning enough to live a life of **dignity**?
2. Is the worker provided with **safe working conditions**?

Case Study I: Noida Garment Strike

- **What happened?**
  - Thousands of workers in the hosiery and garment sector took to the streets in protest, leading to incidents of stone-pelting and a heavy security crackdown.

- **The Trigger – Haryana vs UP**:
  - The strike was triggered by a disparity in wages; the neighboring state of **Haryana had increased its minimum wages**, while **Uttar Pradesh (UP) had not**. Workers demanded that their minimum wage be raised to **₹20,000 per month**.
- **The Aftermath**: The UP government deployed over 1,200 Rapid Action Force personnel, and workers were reportedly beaten. Eventually, the government was forced to raise the minimum wage to **₹13,690 for unskilled workers** and **₹16,868 for skilled workers**.

Vedanta Boiler Blast

- **The Tragedy:** A massive boiler explosion occurred at the Vedanta plant in Chhattisgarh while workers were having lunch, resulting in the **death of more than 20 workers** who were burnt alive.
- **Root Causes**
  - **Lack of Maintenance:** The company failed to conduct regular safety checks on the boiler.
  - **Informalisation of Labour Force:** Most victims were **contractual workers** rather than direct employees. Companies often use this "informalisation" strategy to bypass strict labor rules and regulations.

The 4 New Labour Codes

The government has consolidated previous laws (like the Factories Act 1948) into four new codes: the **Code on Wages**, **Industrial Relations Code**, **Social Security Code**, and the **Occupational Safety, Health and Working Conditions Code**.

While the government views this as consolidation, the sources suggest it **dilutes worker protections** in several ways:

- **Hire and Fire Policy:** Previously, factories with more than 100 workers needed government permission to terminate employees. The new codes have increased this **threshold to 300 workers**, giving employers more freedom to "hire and fire" without oversight.
- **Factory Definition Changed:** The criteria for what constitutes a "factory" has been narrowed.
  - For units using electricity, the worker threshold increased from **10 to 20**.
  - For units not using electricity, the threshold increased from **20 to 40**.
  - **Context:** This change means thousands of small textile, metal, and hosiery units are **no longer legally classified as factories**, exempting them from various safety and labor regulations.
- **Self-Certification and Inspections:** To improve the "Ease of Doing Business," the government replaced the "Inspector Raj" with a **self-certification model**. Factory owners now certify their own compliance, which the sources claim is often done fraudulently, while inspectors have been relegated to mere "facilitators".
- **Strike Restrictions:** "Flash strikes" (immediate protests) are now banned. Workers must provide a **60-day prior notice** before striking. Additionally, if more than 50% of workers take "mass leave" simultaneously, it is legally treated as a strike.

Mains Practice:

Q. The recent consolidation of labour laws into four codes appears to prioritize the 'Ease of Doing Business' at the cost of fundamental worker protections and safety protocols. Critically analyze this statement in light of recent industrial protests and accidents. (250 Words, 15 Marks)

Should the PIL jurisdiction be reconsidered?

GS PAPER II: Structure, organization, and functioning of the Judiciary.

Context:

Public Interest Litigation (PIL) **emerged in the 1970s** to relax the doctrine of *locus standi*, enabling access to justice for marginalized groups. It transformed the judiciary into a proactive protector of fundamental rights.

Context of PIL:

- **Definition of Locus Standi:** Historically, the legal system followed the concept of "Locus Standi" (Right to Stand), where only an individual directly affected by an action could approach the court for relief.
- **Evolution in India:** In the 1970s, **Justice P.N. Bhagwati and Justice Krishna Iyer** diluted this concept.
  - They recognized that many poor and marginalized people in India lacked the knowledge or resources to approach the courts directly.
- **Shift to Public Interest:** The judiciary allowed individuals or groups (like NGOs and social workers) not directly involved in a case to file petitions in the interest of the general public.
- **Foundational Example:** The case of **Hussainara Khatoon vs. Home Secretary Bihar** (1979) is a key example, where a lawyer filed a petition for thousands of prisoners who remained in jail longer than their maximum possible sentences because their trials hadn't even started.

Issues with PIL: Misuse and Judicial Overreach

- **Frivolous and publicity-driven petitions:** PILs are often filed for personal or political agendas ("agenda-driven litigation").
- **Judicial overreach in policy domains:** Courts sometimes intervene in complex, *polycentric disputes* involving multiple stakeholders, where institutional capacity is limited.
- **"Ambush PILs":** Poorly drafted petitions intentionally filed to influence judicial outcomes negatively.
- **Implementation deficit:** Courts issue directions but lack mechanisms to ensure effective enforcement.

Arguments Against Diluting PIL Jurisdiction

- Despite misuse, socio-economic inequalities persist. Many citizens still lack resources or awareness to approach courts, making PIL indispensable for protecting rights and ensuring state accountability.

Way Forward

The source highlights that while PIL was intended for the marginalized, it is now often **misused for publicity, political agendas, or "Ambush PILs"** (poorly drafted petitions meant to be rejected to block future litigation). To address these issues, the following conclusions are drawn:

- **Policy vs. Law:** PILs should be used to ensure the government follows **existing laws** or to challenge **executive actions**, but they should **not be used to force the judiciary to create new policies** (such as implementing a Uniform Civil Code).
- **Principle of Compulsion:** PILs should ideally be restricted to cases where the directly affected person is **under a "compulsion"** that prevents them from approaching the court themselves, such as in **Habeas Corpus** cases (e.g., kidnapping or illegal detention).
- **Judicial Vigilance:** The judiciary must remain alert to **agenda-driven litigation** and continue to impose costs or fines on those who file petitions purely for headlines rather than genuine public interest.
